## T\&B® Cable Tray

## Long-span AH1-8 series aluminum cable tray

NEMA VE-1 Section 5.2.2 states that for each design of cable tray, two specimens shall be tested. An unspliced straight section of the greatest width shall be used in each test. ABB decided to conduct further testing on multiple length to width ratios and lateral torsional buckling considerations resulting in the following data.

All calculations and data in Table 1 are based on cable trays with rungs spaced on 12 in . centers with tray supported as simple spans with deflection measured at the midpoint. Continuous spans may reduce the deflection by as much as $50 \%$.

## Deflection factor

For lighter loads, deflection at any length can be calculated by multiplying the load by the deflection factor.

The load ratings are total load including environmental factors such as snow loads. Dynamic loads such as wind will also need to be considered. Refer to the technical section of the T\&B Cable Tray catalogue for more information.
