# Underground distribution switchgear Molded vacuum switches and fault interrupters 

## MVS molded vaccum switches

Spring-energy, load-switching devices that make, carry and interrupt load currents through 600 A on 5 to 38 kV distribution systems.

MVS molded vacuum switches include molded-in elbow connection interfaces and spring-energy mechanisms. Available in both single- and threephase models, units are manually operated with a hotstick. Motor operator, SCADA and auto-transfer control options are available.

- EPDM molded rubber insulation - MVSs are fully sealed and submersible.
- Vacuum switching and vacuum - Interruption Components are maintenance-free and require no gas or oil.
- Compact and lightweight - Small footprint enables MVSs to fit in tight padmount, subsurface, vault or riser pole installations.

Single-phase switches approximate weight: 30 lbs.

(4) Mounting holes, $5 / 8^{" ~ d i a . ~} x^{7 / 8 "}(16 \times 22 \mathrm{~mm})$

(4) Mounting holes, $5 / 8^{"}$ dia. $\times 7 / 8^{\prime \prime}(16 \times 22 \mathrm{~mm})$

## Application information

- Construction: Submersible, corrosion resistant, fully shielded
- Ambient temperature range: $-40^{\circ} \mathrm{C}$ to $65^{\circ} \mathrm{C}$

## Certified tests

MVS loadbreak switches have been designed and tested per applicable portions of IEEE, ANSI, NEMA and other industry standards, including: IEEE C37.74 standard for subsurface, vault and padmounted load-interrupting switches IEEE 386 standard for separable connectors and bushing interfaces
IEC 265 international standards for load-
interrupting switches
ANSI C57.12.28 standard for padmount enclosures

## Underground distribution switchgear <br> MVI molded vacuum fault interrupters

Make, carry and automatically interrupt currents through 25,000 A symmetrical on 5-38 kV distribution systems.

- Vacuum interrupters, programmable, electronic, self-powered controls and EPDM rubber insulation provide compact, lightweight and submersible overcurrent protection
- Field programmable with a wide range of time-current characteristic (TCC) curves and trip settings
- TCC curves provide predictable tripping for ease of coordination with upstream and/or downstream protective devices
- Control monitors the circuit condition - when the programmed parameters are exceeded, a signal is sent to the tripping mechanism
- Available motor operators and controls enable radial feeders or loops to be reconfigured, either manually or via SCADA

MVI molded vacuum fault Interrupters include molded-in elbow connection interfaces and trip-free mechanisms. They are available in single- and three-phase models.

## Application information

Construction: submersible, corrosion resistant, fully shielded
Operating temperature range: $-40^{\circ} \mathrm{C}$ to $65^{\circ} \mathrm{C}$

## Molded vacuum interrupter and switchgear controls

Choose among various electronic control options to interrupt faults

01 Internal control
-
O2 External control

- Self-powered electronic control packages No batteries or external power are required
- Controls send a signal to the vacuum interrupters to trip open and interrupt the fault when an overcurrent condition is detected
- Field-selectable fuse or relay curves and trip settings - one device for many protection schemes

Molded vacuum interrupters are provided with self-powered electronic control packages requiring no batteries or external power. Depending on the application, six electronic control options are available for the MVI See below and on following page.

$\overline{02}$

## Internal control

This control is integral to the unit (no separate control box). It is accessible via a computer connection to view or modify settings. This control is used on ganged three-phase or singlephase MVI interrupters. Phase and ground trip, as well as inrush restraint, are available. The E-Set software enables the user to connect to the internal control, either in the shop or in the field, to program or change settings. An MVI-STP-USB programming connector is required to connect between the PC and the MVI. With a computer connected to the MVI control, the user can view real-time currents, the number of overcurrent protection operations, current magnitude of the last trip and the phase/ground fault targets. This is the standard control option.
Note: E-Set can be downloaded from www.elastimoldswitchgear.com.

External control with selectable single-/ three-phase trip function (style 80)
This control is mounted externally to the mechanism of the interrupter and provides the ability to select between a single-phase trip and a three-phase trip. The 80 can be used with one three-phase interrupter or the 380 control with three single-phase interrupters. For three-phase applications, the ground trip function can be blocked from the front panel. Manual trip and reset target buttons are also located on the front panel. This control uses the E-Set software, which enables programming via a computer using the MVI-STPUSB adapter. E-Set features custom TCC curves and provides access to the last fault event information, as well as real-time current per phase.

## Multi-way unit construction

Multi-way vault and padmount units are built using MVS and MVI modules as required by the application. These are mounted onto the ES multiway common bus system and assembled on a freestanding, floor-mounted frame. At this stage, the product is ready to be used in vault installations.

For padmount installations, a double-sided, dropover, painted, mild steel enclosure is provided. Munsell Green 7GY 3.29/1.5 is the standard enclosure color. Other colors are available upon request. Painted stainless steel or fiberglass enclosures are available as options.

Note: $\mathrm{X}=6$ for 600 A or 2 for 200 A .
$Y Y=10,20,30,80$ for different electronic controls. Consult your local representative on 38 kV multi-way configurations.

[^0]:    NOTE: Leave suffix blank for internal (self-contained) control.
